Sentiment Analysis Results on the CMU-MOSI Training and Validation Sets

We report the unimodal and multimodal results on the training and validation sets of the CMU-MOSI database in Tables 1 and 2.

In these tables, "S" is the single-task learning model; "S+P" is the bi-task learning model with polarity classification as the auxillary task; "S+I" is the bi-task learning model with intensity classification as the auxillary task; "S+P+I" is the tri-task learning model.

To evaluate the performance of sentiment score prediction, we report both Pearson's correlation coefficient (CC, higher is better) and mean absolute error (MAE, lower is better) between predictions and annotations of sentiment scores.
